

FARM FITNESS CHECKLIST

Milk Quality

Checklist for Milk Quality adapted from Dairy Australia's Our Farm, Our plan program

KEY CONTACTS

Regional Teams are the place to go about what's happening in your region. Contact them to find out about 'Our Farm, Our Plan' and other training, workshops, events and resources that are available. Through the Regional Teams Dairy Australia supports farmer groups, including discussion groups, Young Dairy Network groups and others. Contact them about 'Our Farm, Our Plan' group activities and other programs that your group might benefit from.

MILK QUALITY

Farm Fitness Checklist

This resource has been developed using the Our Farm, Our Plan approach. It is designed to provide a detailed appraisal of your drying off practices and help you identify and prioritise improvements that are tailored to your farm and business.

Instructions

Work through each row of the checklist and rate how you feel your business is performing. This is designed to prompt your thinking about different aspects of your drying off practices and identify opportunities for improvement. It's a 'self-assessment' and there are no right or wrong answers. Your job is to identify areas that might be a priority for you by ticking the box that best describes where you are at for each question.

It is also recommended that you complete the quick SWOT. SWOT stands for Strengths, Weaknesses, Opportunities, and Threats. Strengths and weaknesses are internal factors, like the farm team, staff turnover, training, infrastructure, and location. Opportunities and threats, by contrast, are usually external factors, like milk price, beef prices, feed price and adverse weather.

Try scanning through the checklist before you start ticking so that you have an idea of what's included. The aim is to identify and focus on a small number of areas that will move you forward significantly.

In each section of the checklist there is also list of resources that you might find useful. Many of these can either be found on Dairy Australia's **websitedairyaustralia.com.au**, ordered in hard copy or will be provided at Milking and Mastitis Management workshops. Information and support are also available from your Dairy Australia Regional Team. They are your local connection point to Dairy Australia (see contact information at left).

Now, where, how?

Completing the checklist will give you a good sense about where your drying off management is currently. You will work through getting your 'where and how' down on paper together with the support of your experienced Countdown consultant. However, you can also use this checklist by yourself or together with your farm team.

Our Farm, Our Plan

If you have not yet done so, it is recommended you consider attending an Our Farm, Our Plan program which steps you through a similar process for all aspects of your farm business. Our Farm, Our Plan is a program designed to assist farmers to use the plans that are often in their heads to develop a clear understanding of their longterm business and personal goals.

DRYING OFF

	Yes, we've nailed it	Ok, but we could do better	No, and we should do something about it	No, and it's not relevant to us
	✓	✓	\checkmark	✓
Our bulk milk cell count (BMCC) is generally less than 150,000 cells/ml				
Less than 5% of mature cows get clinical mastitis in the first 14 days after calving				
Less than 5% of heifers get clinical mastitis in the first 14 days after calving				
We cull cows that have had three cases of clinical mastitis in a lactation regardless of quarter				
We cull three titters if they continue to get mastitis				
We use herd test data to cull cows that have had high cell counts for two consecutive lactations with dry cow treatment in the dry period in between				
We undertake early pregnancy diagnosis and use these records to decide when cows should be dried off				
Most cows calve after a dry period of at least 8 weeks				
Our cow ID is sufficient to enable accurate and easy pregnancy diagnosis				
Most cows are dried off when they are producing between 5 and 12L per day				
If cows are producing more than 12L per day, we modify their diet to reduce production. We do not alter milking frequency before drying off				
 We use selective (part-herd) dry cow therapy in our herd, and we have: At least one individual cow cell count (ICCC) for each cow within at least 80 days of planned drying off date Complete and accurate clinical case records Less than 25 clinical cases of mastitis per 100 cows (25%) within the last 12 months No Streptococcus agalactiae based on PCR testing and individual cow milk cultures. 				
We use teat sealants in first-calving heifers 30 days prior to calving				
All staff having received third-party training in correct dry-off technique within the last three years				
Cows are marked and recorded prior to any dry cow treatments being administered				

	Yes, we've nailed it	Ok, but we could do better	No, and we should do something about it	No, and it's not relevant to us
Clean gloves are always worn when drying off cows				
Teat ends are thoroughly cleaned and disinfected with 70% alcohol prior to tube insertion				
Only the tips of tubes are inserted into the teat orifice				
Teat disinfectant is applied as soon as possible after administration of dry cow therapy				
Cows are dried off immediately after their last milking for the lactation				
No more than 20 cows are dried off per person per hour				
Cows go into a clean, dry area immediately after drying off				
Cows are checked daily for at least a week after drying off for clinical mastitis				
We use a mastitis focus report to review our drying off and mastitis control practices at least annually				

QUICK SWOT

STRENGTHS	WEAKNESSES
OPPORTUNITIES	THREATS

Our action plan

Reflect on the ratings you have given yourself. Note the areas you want to focus on or could see opportunities in improving. List below two to three actions you plan to take.

OUR ACTIONS	BY WHO	BY WHEN	PRIORITY		
			High	Medium	Low
